~~The vascular beds of the adult lung, the pulmonary and bronchial circulations, are formed by extensive branching systems of large and small arteries and veins, and capillary networks. The focus of this chapter is the development of the pulmonary circulation in the normal lung as this evolves through the embryo/fetus to birth and the postnatal stage; and its continued development through childhood to the adult.~~

~~What is Pulmonary Vascular Disease? Basically, it is any condition that affects the blood vessels is the route between the lungs and the heart. In its normal flow, blood travels from the heart to the lungs, and then back to the heart. This process is extremely important because the lungs are continually loading blood with oxygen.~~

~~Pulmonary Vascular Development. The pulmonary vasculature develops in close coordination with the bronchial tree and distal airspaces and recent evidence indicates a close interdependence between capillary development and alveolar formation. For effective gas exchange to occur at birth it is essential that the pulmonary vascular bed has developed to such an extent that alveoli are richly endowed with a dense capillary network and that the vascular bed can accept the entire cardiac output ...~~

Chapter 3 Fetal Vascular Malperfusion. In the page on umbilical cord accident I discussed the ways in which blood flow through the umbilical cord could be occluded by compression, either directly or through torsion, or even through arterial wall contraction. Another way in which fetal blood flow can be stopped is clotting of blood within the umbilical and placental vessels, pathologically defined as thrombosis or thrombus formation.

to either hypoxia and/or hyperoxia contributes to disruption of the normal development of the pulmonary vascular bed, resulting in endothelial dysfunction, pulmonary vascular remodeling, and ultimately right ventricular dysfunction (Chapter 2). PVD represents an increasing clinical burden, both in the neonatal period and later in life.

In Chapter 3, two distinct and well established rat models (hypoxic and monocrotaline) of PAH were used to determine the regulation of miRNAs during disease initiation and progression. We demonstrate time and insult-dependent changes in a specific group of miRNAs and this dysregulation was also confirmed in vitro in rat and human PA cells exposed to chronic hypoxia.
