A fiber Bragg grating is a type of distributed Bragg reflector constructed in a short segment of optical fiber that reflects particular wavelengths of light and transmits all others. This is achieved by creating a periodic variation in the refractive index of the fiber core, which generates a wavelength-specific dielectric mirror. A fiber Bragg grating can therefore be used as an inline optical filter to block certain wavelengths, or as a wavelength-specific reflector.

This photosensitivity of optical fibers allows the fabrication of phase structures in the core of fibers called the fiber Bragg grating (figure 2.1).

Photosensitivity refers to a permanent change in the index of refraction of the fiber core when exposed to light with characteristic wavelength and intensity that depend on the core material.

The book has a wonderful balance between the theory and applications of Fiber Bragg Gratings (FBGs), something that is lacking in Kashyap's book. The first 4 chapters (not including the introduction) give a nicely detailed theory for FBGs, including several sections in the "Properties of Fiber Bragg Gratings" (chapter 3) that are not covered in Kashyap's treatment.

A FIBER Bragg grating (FBG) is a periodic perturbation of the refractive index along the fiber length which is formed by exposure of the core to an intense optical interference pattern. The formation of permanent gratings in an optical fiber was first demonstrated by Hill et al. in 1978 at the Canadian Communications Research Centre
