The batch glass reactor are vessels that are used for several processes that include product mixing, chemical reactions, crystallization, and batch distillation. The batch reactors include combinations of multiple tanks, a cooling-system and storage tanks with agitators. These vessels are available in different sizes and will depend on the industries that they are used in.

Step 1: Collect Required Data. Out of all process equipment, reactor design requires the most process input data: reaction enthalpies, phase-equilibrium constants, heat and mass transfer coefficients, as well as reaction rate constants.

Batch reactor - Wikipedia

By sizing a chemical reactor we mean we're either determining the reactor volume to achieve a given conversion or determine the conversion that can be achieved in a given reactor type and size. Here we will assume that we will be given $-r_A = f(X)$ and F_{A0} . In chapter 3 we show how to find $-r_A = f(X)$. Given $-r_A$ as a function of conversion, $-r_A = f(X)$, one can size any type of reactor.
