Smart Grid: Networking, Data Management, and Business Models delivers a comprehensive overview of smart grid communications, discussing the latest advances in the technology, the related cyber security issues, and the best ways to manage user demand and pricing. Comprised of 16 chapters authored by world-renowned experts, this book: Considers the use of cognitive radio and software-defined networking in the smart grid Explores the space of attacks in the energy management process, the need for a smart grid simulator, and the management issues that arise around smart cities Describes a real-time pricing scheme that aims to reduce the peak-to-average load ratio Explains how to realize low-carbon economies and the green smart grid through the pervasive management of demand Presents cutting-edge research on microgrids, electric vehicles, and energy trading in the smart grid Thus, Smart Grid: Networking, Data Management, and Business Models provides a valuable reference for utility operators, telecom operators, communications engineers, power engineers, electric vehicle original equipment manufacturers (OEMs), electric vehicle service providers, university professors, researchers, and students.

Band theory is evident all around us and yet is one of the most stringent tests of quantum mechanics. This textbook, one of the first in the new Oxford Master Series in Physics, attempts to reveal in a quantitative and fairly rigorous fashion how band theory leads to the everyday properties of materials. The book is suitable for final-year undergraduate and first-year graduate students in physics and materials science.

Electronics – From Theory Into Practice deals with design procedures in electronics and bridges the gap between theoretical knowledge and practice. It provides design examples and discusses the use of the Laplace Transform for solving engineering problems. The book introduces bipolar and field effect transistor, the unijunction transistor and the silicon-controlled rectifier, and shows how data sheets are used in design calculations. It then examines the development of integrated circuits and their

characteristics. Following this discussion are chapters that contain a brief treatment of theory limited to the extraction of necessary design relationships. The book concludes by considering the general aspects of electronic engineering practice. This book will be of use to practising engineers, particularly those trained in other disciplines, who are taking on a certain amount of electronic design.

This textbook presents the basic elements needed to understand and engage in research in semiconductor physics. It deals with elementary excitations in bulk and low-dimensional semiconductors, including quantum wells, quantum wires and quantum dots. The basic principles underlying optical nonlinearities are developed, including excitonic and many-body plasma effects. The fundamentals of optical bistability, semiconductor lasers, femtosecond excitation, optical Stark effect, semiconductor photon echo, magneto-optic effects, as well as bulk and quantum-confined Franz-Keldysh effects are covered. The material is presented in sufficient detail for graduate students and researchers who have a general background in quantum mechanics. Request Inspection Copy

For the New Century Issue of the journal "Theoretical Chemistry Accounts" the advisory editors identified papers from the first century of theoretical chemistry and discussed their importance for the twentieth century with an eye towards the twenty-first century. Sixty-six such perspectives are published in the New Century Issue. To make this unique collection available to younger scientists for

entertaining reading and re-reading of the original publications, the publisher decided to reprint a special edition of the issue.

Writing more than one hundred years ago, African American scholar W.E.B. Du Bois speculated that the great dilemma of the twentieth century would be the problem of "the color line." Nowhere was the dilemma of racial discrimination more entrenched-and more complex-than South Africa. Gordian Knot examines South Africa's freedom struggle in the years surrounding African decolonization, using the global apartheid debate to explore the way new nation-states changed the international community during the mid-twentieth century. At the highpoint of decolonization, South Africa's problems shaped a transnational conversation about nationhood. Arguments about racial justice, which crested as Europe relinquished imperial control of Africa and the Caribbean, elided a deeper contest over the meaning of sovereignty, territoriality, and development. Based on research in African, American, and European archives, Gordian Knot advances a bold new interpretation about African decolonization's relationship to American power. In so doing, it promises to shed light on U.S. foreign relations with the Third World and recast understandings of the fate of liberal internationalism after World War II.

This pathmaking treatise on macrotheoretical science argues that a brink separates an explanatory theory of international politics from those approaches that lack basic standards for theoretical construction--a brink which must be bridged if the discipline is to develop. Formulated on the basis of a pragmatic philosophy of science, its most general arguments cross the boundaries of the social sciences, including the standard subdisciplinary boundaries of international relations. Although the substantive theories in the book tend to be about systems usually characterized as power politics, the basic approach and categories could be used to analyze systems of international political economy, international organization, or comparative politics.
