So far this is the best text on Linear Algebra I have read. I have worked through several textbooks of Linear Algebra, some completely and many others I gave up on. In my opinion the better texts are Shilov's, Hefferon's, and Strang's, but Williams is the way to go if you are doing this on your own.

Part of the new Digital Filmmaker Series! Digital Filmmaking: An Introduction is the first book in the new Digital Filmmaker Series. Designed for an introductory level course in digital filmmaking, it is intended for anyone who has an interest in telling stories with pictures and sound and won't assume any familiarity with equipment or concepts on the part of the student. In addition to the basics of shooting and editing, different story forms are introduced from documentary and live events through fictional narratives. Each of the topics is covered in enough depth to allow anyone with a camera and a computer to begin creating visual projects of quality.

This book makes a case for infrapolitics as an enactment of intellectual responsibility in the face of a tumultuous world of war and of technological value extraction on a planetary scale. Infrapolitical Passages proposes to clear a way through some of the dominant political determinations and violent symptoms of contemporary globalization. In doing so, Gareth Williams makes a case for infrapolitics as an enactment of intellectual responsibility in the face of a tumultuous world of war and of technological value extraction on a planetary scale. The book offers a theory of globalization as a gigantic, directionless crisis in humanity's symbolic organization, as well as a theory of global economic warfare as the very positing of directionlessness and, at the same time, facticity. Williams's infrapolitics stands at a distance from the biopolitical, which it understands as domination presenting itself as the production of specific forms of subjectivity in the face of the commodity. The subsequent obscuring of being signals the need to circumvent the instrumentalization of life as subordination to the metaphysics of subjectivity, representation, and politics. Infrapolitical Passages works to confront that which is unavailable in subjectivity and representation, opening a way for facticity in the age of globalization in order to make room for the infrapolitical question for existence.

Holt's Linear Algebra with Applications, Second Edition, blends computational and conceptual topics throughout to prepare students for the rigors of conceptual thinking in an abstract setting. The early treatment of conceptual topics in the context of Euclidean space gives students more time, and a familiar setting, in which to absorb them. This organization also makes it possible to treat eigenvalues and eigenvectors earlier than in most texts. Abstract vector spaces are introduced later, once students have developed a solid conceptual foundation. Concepts and topics are frequently accompanied by applications to provide context and motivation. Because many students learn by example, Linear Algebra with Applications provides a large number of representative examples, over and above those used to introduce topics. The text also has over 2500 exercises, covering computational and conceptual topics over a range of difficulty levels.

David Poole's innovative LINEAR ALGEBRA: A MODERN INTRODUCTION, 4e emphasizes a vectors approach and better prepares students to make the transition from computational to theoretical mathematics. Balancing theory and applications, the book is written in a conversational style and combines a traditional presentation with a focus on student-centered learning. Theoretical, computational, and applied topics are presented in a flexible yet integrated way. Stressing geometric understanding before computational techniques, vectors and vector geometry are introduced early to help students visualize concepts and develop mathematical maturity for abstract thinking. Additionally, the book includes ample applications drawn from a variety of disciplines, which reinforce the fact that linear algebra is a valuable tool for modeling real-life problems. This volume offers a serious study of the fundamentals of symbolic logic that will neither frustrate nor bore the reader. The emphasis is on developing the

students grasp of standard techniques and concepts rather than on achieving a high degree of sophistication. Coverage embraces all of the standard topics in sentential and quantificational logic, including multiple quantification, relations, and identity. Semantic and deductive topics are carefully distinguished, and appendices include an optional discussion of metatheory for sentential logic and truth trees.

This is a textbook for 4th quarter calculus covering the Vectors, Vector-Valued Functions, Functions of Several Variables, and Double Integrals. It has explanations, examples, worked solutions, problem sets and answers. It has been reviewed by calculus instructors and class-tested by them and the author. Besides technique practice and applications of the techniques, the examples and problem sets are also designed to help students develop a visual and conceptual understanding of the main ideas. The exposition and problem sets have been highly rated by reviewers.
